

Our variables

- y_i : **caterpillar growth** - response variable
- x_i : **quantity of tannin in the caterpillar diet** - predictor variable,

Spring Roll

x: tannin

Our variables

- y_i : **caterpillar growth** - response variable
- x_i : **quantity of tannin in the caterpillar diet** - predictor variable,

Lets ask a question

Do leaf chemical compounds reduce the growth of caterpillars?

- Our model

$$y_i \sim N(\mu_i, \sigma)$$

$$\mu_i = \alpha + \beta x_i$$

$$\alpha \sim N(0,1)$$

$$\beta \sim N(0,1)$$

$$\sigma \sim \text{Exp}(1)$$

The relation between growth and tannins is given by the slope parameter β
