What now?!

Using DAGs to build models

- If we represent our putative causal relations using DAGs, we have a set of rules that tells us what variables we need to include in the model in order to calculate a particular effect, or if the effect can be estimated at all
 - This is a formalism called do-calculus
- There are also more complicated methods, like Structural Equation Modeling or Full-Luxury Bayesian Inference:
 - Regression, Fire, and Dangerous Things (1/3)
